

The invention relates to a television system of the type which includes a display screen, a broadcast data receiver for the reception of video, audio and auxiliary data from a broadcast service provider and the generation of television programmes therefrom for display on the display screen and via speakers. The system allows a user to select a viewing time period in which they wish to watch a programme, typically in its entirety. The system identifies those of the available programmes at the start of the viewing time period which can be watched in their entirety in said period and indicates the same to the user who can then select to watch the same or one of the same. The user can therefore quickly select a television programme for a given period of time thereby greatly reducing the time which may be spent flicking through channels to find a suitable programme.
